

Appendix Table 20- Tests of Models of Peer Effects Using Estimates from Table 7 - Bonferroni Adjusted

Model	A. Math				B. ELA			
	<i># of estimates significant in direction the model suggests</i>	<i># of estimates insignificant</i>	<i># of estimates significant in opposite direction</i>	<i>Consistent, Inconsistent, or neither?</i>	<i># of estimates significant in direction the model suggests</i>	<i># of estimates insignificant</i>	<i># of estimates significant in opposite direction</i>	<i>Consistent, Inconsistent, or neither?</i>
(1) Weak Monotonicity <i>Effect of evacuees from top quartile is statistically significantly greater than effect from bottom quartile.</i>	4	0	0	Consistent	3	1	0	Consistent
(2) Strong Monotonicity <i>Effect of evacuees from quartile j is statistically significantly greater than effect from quartile j - 1.</i>	0	12	0	Neither	1	11	0	Neither
(3) Invidious Comparison <i>Effect of evacuees from lower quartiles than the incumbent is positive and effect from evacuees in higher quartiles is negative.</i>	0	8	4	Inconsistent	0	10	2	Inconsistent
(4) Ability Grouping <i>Effect of evacuees from own quartile is statistically significantly greater than effect from higher quartiles.</i>	0	6	2	Inconsistent	0	6	2	Inconsistent

See text for the specific tests conducted for each model. Significance of tests is based on Bonferroni adjusted p-values to account for testing of multiple outcomes.
