Standard errors are provided in parentheses and clustered by school. Regressions cover 2003-04 - 2006-07 and include student's race, gender, free/reduced price lunch status, grade-by-year fixed effects, school fixed-effects, and lagged achievement from the student's most recent pre-Katrina lagged score interacted with indicators for the number of years between exams. TAKS scores are standard deviations of scale scores within grade and year based on statewide means and standard deviations. When students have multiple scores for a single subject in a given year we use the lowest score. Placebo regressions are limited to pre-Katrina years and apply the 2005-06 evacuee shares to 2004-05 observations. Quartiles are determined using the most recent pre-Katrina score available and are within grade and year across the district. Elementary is defined as any student in grades 3 - 5. Middle/High is any student in grade 6 - 11. *, **, and *** reflect significance at the 10%, 5%, and 1% levels, respectively.
